

# FILTREX™ 2022 Closes After a Successful Edition

14 November 2022

Around 100 filtration media professionals gathered in Berlin, Germany last week for a two-day conference on topics relating to filtration. The programme addressed issues from sustainability to testing and standardisation, as well as providing inspiring insights on future trends in the health and the automotive industries.

The Copenhagen Institute for Future Studies provided a keynote presentation on a proposed move from curative to preventive healthcare. As a result of the COVID-19 pandemic consumers today are increasingly aware of the quality of the air we breathe, which has a key impact on our health. As such filtration will only continue to grow in importance, as society looks to improve living and working conditions to ensure healthy lifestyles. Several of the speakers addressed this by showcasing product developments in filter media that can be used in domestic and institutional buildings' filtration systems.
